Position Paper

Semani Poonolly (Vannevar Bush - OSRD)

The development of the Atomic bomb poses a severe threat to global safety and extends the boundary of scientific development. It is true that as we discover the unimaginable threat of nuclear war, the global community enters a sort of “dark forest” conundrum. The question is, how can we truly trust that our neighboring countries are truly not at risk of attacking us, without arming ourselves first. In 1941, the MAUD committee released their final reports which indicated that as little as 25 pounds of U-235 could result in a detonation of 1800 tons of TNT and irradiate a large swathe of land. What needs to happen is large scale relegation and documentation of weapons. Countries must be transparent about the amount of weapons they possess, the specifics of the weapons they control and the extent to which they plan on utilizing them.

At the OSRD, a pioneer of nuclear research funding, maintaining global security is a top priority and with our expansion of research and maintenance, the power of mass destruction remains out of the hands of potential adversaries, fascists and extremists alike. We have seen warnings of the destruction caused by the atomic bomb. Right now, the Congolese hold the power in Belgium controlled Congo, this is not acceptable. The production of uranium should be seen as the starting and stopping point of nuclear power and global destruction, meaning it must be held in the hands of the most qualified nation in the global sphere. The OSRD calls for every allied power to come together and consolidate our research in a transparent and well documented resource bank. We must not let the Germans access these resources and utilize them against us, we cannot aid the Japanese in spreading their imperial agenda by allowing them to access weapons of mass destruction and we will not watch as fascist Italians spread Mussolini's message by force, backed by the power of world destruction in their hands. The atomic bomb may defeat our enemies, but it will certainly destroy our world. Thus understanding the necessity of global comradery, the OSRD, and by extension, America, urges countries to share and collaborate.

As a global power with the resources to delegate international arms research, the OSRD volunteers to manage the allocation of resources. While our allied nations focus on World War, we believe that through the use of teamwork, collaboration and resource pooling, we absolutely can create a society that utilizes nuclear weapons out of necessity and in the pursuit of suppressing evil and championing good. The OSRD has licensed all of the research we fund, and would be more than willing to start the global shift towards nuclear peace and collaboration. Countries must hand over their resources, research and access to uranium and receive access to a global club of sorts, together we can strengthen all our power, together we can move towards global peace.
